PhD Position in Marine Microbial Ecology

The **Kranzler Lab** is seeking a curious and highly motivated doctoral candidate to join a new and exciting ERC-funded research project. The project is designed to advance our understanding of the underlying factors that shape microscale interactions within phytoplankton blooms in the ocean. Research will focus on characterizing the molecular ecology of natural diatom assemblages. Work will be field-based, relying upon observational and manipulative sampling approaches and will incorporate physiological, biogeochemical and molecular, omics-based techniques.
